a first course in machine learning covers the core mathematical and statistical techniques needed to understand some of the most popular machine learning algorithms the algorithms presented span the main problem areas within machine learning classification clustering and projection the text gives detailed descriptions and derivations for a small number of algorithms rather than cover many algorithms in less detail referenced throughout the text and available on a supporting website [bit.ly/firstcourseml](http://bit.ly/firstcourseml) an extensive collection of matlab octave scripts enables students to recreate plots that appear in the book and investigate changing model specifications and parameter values by experimenting with the various algorithms and concepts students see how an abstract set of equations can be used to solve real problems requiring minimal mathematical prerequisites the classroom tested material in this text offers a concise accessible introduction to machine learning it provides students with the knowledge and confidence to explore the machine learning literature and research specific methods in more detail

while the standard sophomore course on elementary differential equations is typically one semester in length most of the texts currently being used for these courses have evolved into calculus like presentations that include a large collection of methods and applications packaged with state of the art color graphics student solution manuals the latest fonts marginal notes and web based supplements all of this adds up to several hundred pages of text and can be very expensive many students do not have the time or desire to read voluminous texts and explore internet supplements that's what makes the format of this differential equations book unique it is a one semester brief treatment of the basic ideas models and solution methods its limited coverage places it somewhere between an outline and a detailed textbook the author writes concisely to the point and in plain language many worked examples and exercises are included a student who works through this primer will have the tools to go to the next level in applying odes to problems in engineering science and applied mathematics it will also give instructors who want more concise coverage an alternative to existing texts this text also encourages students to use a computer algebra system to solve problems numerically it can be stated with certainty that the numerical solution of differential equations is a central activity in science and engineering and it is absolutely necessary to teach students scientific computation as early as possible templates of matlab programs that solve differential equations

are given in an appendix maple and mathematica commands are given as well the author taught this material on several occasions to students who have had a standard three semester calculus sequence it has been well received by many students who appreciated having a small definitive parcel of material to learn moreover this text gives students the opportunity to start reading mathematics at a slightly higher level than experienced in pre calculus and calculus not every small detail is included therefore the book can be a bridge in their progress to study more advanced material at the junior senior level where books leave a lot to the reader and are not packaged with elementary formats j david logan is professor of mathematics at the university of nebraska lincoln he is the author of another recent undergraduate textbook applied partial differential equations 2nd edition springer 2004

this textbook is for a first course on electronics it assumes no prior electronics experience but does assume that students have had calculus 1 single variable differential calculus and high school physics a key idea of the course is that students need a lot of design experience and hands on work rather than a lot of theory the course is centered around the labs which are a mix of design labs and measurement modeling labs this unique volume takes students from knowing no electronics to being able to design and build amplifier and filter circuits for connecting sensors to microcontrollers within 20 weeks students design a digital thermometer a blood pressure meter an optical pulse monitor an ekg an audio preamplifier and a class d power amplifier they also learn how to measure and characterize components including impedance spectroscopy of a loudspeaker and of electrochemical electrodes related link s

this book is the leader among the new generation of text books on quality that follow the systems approach to creating quality in products and services the earlier generations focused solely on parts of the system such as statistical methods process control and management philosophy it follows the premise that the body of knowledge and tools documented by quality professionals and researchers when employed in designing creating and delivering the product will lead to product quality customer satisfaction and reduced waste the tools employed at the different stages of the product creation cycle are covered in this book using real world examples along with their theoretical bases strengths and weaknesses this textbook can be used for training from shop floor personnel to college majors in business and engineering to practicing professionals graduate students training as researchers in the quality field will also find useful material the book has been used as the text for a professional series massive open online course offered by the technical university of munich on edx org through which tens of thousands of participants from all over the world have

received training in quality methods according to professor dr holly ott who chose the book for the course the text is one of the main factors contributing to success of this mooc the third edition has been fully revised to be friendly for self study reflects changes in the standards referenced such as iso 9000 and includes new examples of application of statistical tools in health care industry features reviews the history of quality movement in the u s and abroad discusses quality cost analysis and quality s impact on a company s bottom line explains finding customer needs and designing the product using house of quality covers selection of product parameters using doe and reliability principles includes control charts to control processes to make the product right the first time describes use of capability indices cp and cpk to meet customer needs presents problem solving methodology and tools for continuous improvement offers iso 9000 baldrige and six sigma as templates for creating a quality system

this fifth edition of lang s book covers all the topics traditionally taught in the first year calculus sequence divided into five parts each section of a first course in calculus contains examples and applications relating to the topic covered in addition the rear of the book contains detailed solutions to a large number of the exercises allowing them to be used as worked out examples one of the main improvements over previous editions
